A student of Physiotherapy, Ms Julia Pilch, who completed her master's thesis under my supervision titled "Assessment of Quality of Life in a Group of Amputee Football (Amp Football) Players," demonstrated a high level of commitment, diligence, and strong Julia Pilchsubject-matter competence.

Particular recognition should be given to her independence in planning and conducting scientific research, as well as her ability to critically analyze the relevant literature. The topic she chose is current, cognitively valuable, and significant from the perspective of physiotherapy practice, especially in the field of rehabilitation of people with disabilities and in supporting sports activity.

The student performed very well in organizing the research proces - from developing the study concept, through selecting appropriate research tools, to the reliable analysis of the obtained results. Throughout our collaboration, she demonstrated consistency, punctuality, and openness to feedback, which significantly contributed to the high quality of the final thesis.

In conclusion, I assess the student very highly as a competent, ambitious individual who is well prepared to practice as a physiotherapist and to continue her academic development. Her competencies, commitment, and interpersonal skills allow for a confident prediction of her continued success in both clinical practice and research.
